Safety Message

Use universal precautions and appropriate PPE when handling patient or control samples.

Policy

Quality control materials are periodically processed with patient samples to verify acceptable performance of the reagent-instrument-operator system and insure accurate determination and reporting of patient results

Testing Frequency

Quality Control is performed:

- 1. Once every shift for:
 - ISE analytes
 - Trop-I
 - Coagulation Assays:
 - o PT/INR
 - o APTT
 - Fibrinogen
 - o Anti-Xa
 - D-Dimer
- 2. At least once per day for non-ISE or Trop-I
- 3. On day patient sample is tested for:
 - a. Fetal Fibronectin
- 4. After instrument calibration.
- After instrument maintenance.
- When new reagent is loaded on:
 - Beckman Synchron DXC800
 - Beckman DXI 600
 - Sta-R Evolution
 - Roche AVL 9180

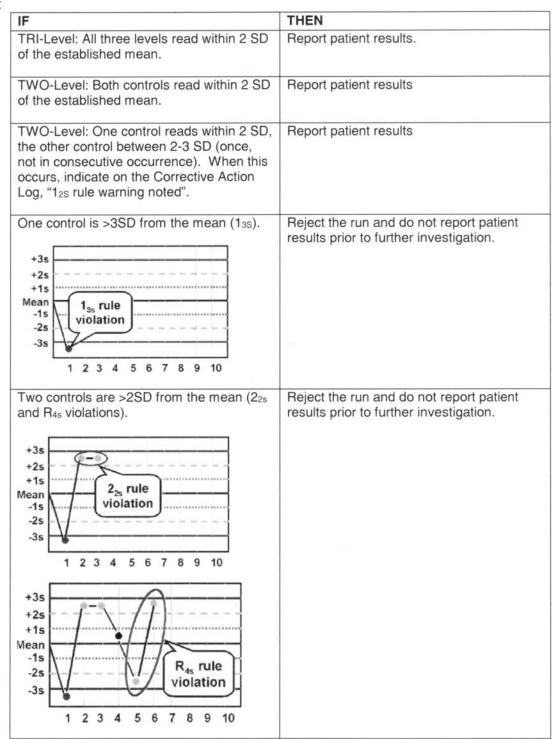

Testing Guidelines

To meet the above objective, quality controls must be evaluated for accuracy shifts and trends. All quality control Westgard rule failures identified must be addressed, corrected, and appropriately documented prior to reporting of patient results.

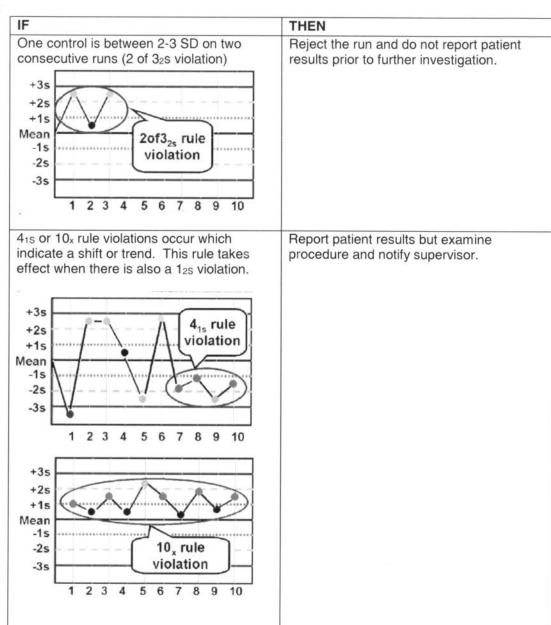

- For the DXC800s, and the DXI 600s the on board QC program Westgard Rules evaluation and Remisol EQC (Extended Quality Control) program is utilized.
- QC results for the Advanced Instruments Osmometer and Roche AVL 9180 ionized Calcium is entered into the Remisol EQC system.
- For the Sta-R Evolutions #1 & #2, the on board QC program is utilized.

It is the responsibility of the CLS or MLT to evaluate the Westgard rule violation(s) and take appropriate action to correct the out-of-control situation and to establish the system is reporting accurate results prior to reporting patient results. Documentation of such action is required in EQC as well as the Chemistry QC Action Log.

Patient Result Reporting

Patient Result Reporting

If the CLS or MLT cannot resolve the problem, they should seek Area Lab manager assistance or designee, assistance and approval prior to reporting patient results.

Corrective Action to be Taken and Documented

- Verify the correct control lot number and control material has been tested.
- Check open expiration of control.
- Check the other components of the procedure and the instrumentation (precision check if indicated).
- Check or verify the instrument calibration (linearity standards and recalibration is necessary).

Area Lab Manager or Designee Review of Action Log

- Check laboratory mean and SD range against interlaboratory quality assurance data and CAP proficiency survey values. Recalculate mean and SD intervals if the current ranges are inappropriate. All supervisory corrective actions are documented in the Supervisory Review section of the Corrective Action Log.
- QC periodic reports will be reviewed, signed and dated at the end of each month by Chemistry Area Laboratory Manager or designee.

Monthly Submission of Cumulative Mean and SD to Peer InterLab Programs

- BioRad Unity Program (Chemistry & Immunoassay Tests):
 - At the end of each month cumulative data (mean, sd & # of data points) is extracted.
 - The data is entered into BioRad Unity Program between the 1st to the 7th of following month.
 - o Report is generated approximately around the 15th of the month.
- Clarity Peer Group Program:
 - At the end of each month cumulative data (mean, sd & # data points) is extracted.
 - The data is entered into Clarity website.
 - Report is generated immediately.

Area Lab Manager or Designee Review of InterLab Reports

- Review the current month's mean to verify that it has not changed significantly from the cumulative mean. A significant shift may indicate a performance issue. Compare the current month's mean to the peer group mean.
- Review the SD. The standard deviation is related to the spread or distribution about the expected Mean. Whereas the mean is an indicator of central tendency and therefore related to accuracy or systematic error, the standard deviation is a measure of the width of the distribution and is related to imprecision or random error. The wider the standard deviation range is, the poorer the precision of the method and vice versa.
- Review the CV of all levels of control analyzed. The CVs should be within the same relative range each month. A CV of 5.0% or less is an acceptable level of variation indicating a well-functioning system.
- CV of the cumulative data is the best indication of the long-term performance of the analyzer.
- Review the SDI calculated for the month. An SDI between -2.0 and +2.0 indicates good correlation within the peer group. A negative sign indicates that your laboratory mean is below the peer group mean, a positive sign indicates that your laboratory mean is above the peer group mean.
- Individual instrument Mean should be between 2 SD of the peer group for best correlation.
- Peer group SD and CV may be higher than the individual instrument statistics because of the variations in instrument operating condition.
- The CVI (stago) and CVR (BioRad) is the relative CV of the individual instrument compared to the peer group CV. Value should be less than 1.0.
- QC periodic reports will be reviewed, signed and dated each month by Chemistry Area Laboratory Manager or designee.

New QC Lot

- Run the new controls 1-3 times per day for a minimum of 7 days to obtain 20 data points. If values meet criteria below, controls are ready for use.
 - For assayed controls, the results must fall within 2 SD of manufacturer's reported mean for each analyte tested.
 - For unassayed controls, the results must fall within 3 SD of the manufacturer's target mean.
 - For assayed coagulation controls, run QC to verify the acceptability ranges supplied by the manufacturer.

CHEMISTRY QC ACTION LOG

DATE: WESTGARD RULE FAILURE: INSTRUMENT: CONTROL NAME: RESULT OBTAINED: CONTROL LOT#: Hi or Low TECH INITIALS: NOTE: Please paperclip QC print-outs to this form and once completed place into QC review bin. CORRECTIVE ACTIONS: 1. Check for alarms on the instrument print-out or monitor. 2. Reanalyze fiesh aliquot of the same control. If result is in range continue patient testing. 3. Repeat test using a freshly reconstituted (or thaw-ed) vial of control. Synchron Results: 5. Repeat daily maintenance, checking for problems with the sample probe, sample valve, pinched tubing, dirty tubing, light source, contaminated reagents, outdated reagents, reagents preparation, etc. CR Recalibrate and rerun the controls. CCRun Results Post-CAL: 7. Call instrument repair or manifacturer hot-line. 8. If unable to resolve the problem, patient specimens are run on in-control instrument or sent out to Sherman Way Regional Reference Lab cratory. 9. All specimens run since the last acceptable QC need to be rechecked and verfified. CORRECTIVE ACTION TAKEN: (Describe solution; mechnical, reagents, calibrator, control, etc.) PATIENTS RE SULT S REPORTE D: YES / NO Supervisor's Review: Date: SUPERVIS OR'S COMMENT:	ALL ITEMS MUST BE COMPLETED
