Phototherapy & PDT

- The use of light (especially UV light) in the treatment of skin conditions may seem like a contradiction.
 - However, “light” can be thought of as a *form of medicine*.
 - Like any medicine, it has risks, but **also has benefits**.

Phototherapy & PDT

In This Module, We Will Be Reviewing...

- PUVA
- Narrowband UVB (NB-UVB) } “Phototherapy”
- Blue Light Photodynamic Therapy (PDT)
 - Often referred to simply as “Blue Light”.

Phototherapy

© 2012 Association of Certified Dermatology Techs

© 2012 Association of Certified Dermatology Techs

PUVA

PSORALEN → “PUVA” ← UVA

- *Used to treat a variety of conditions, including...*
 - Psoriasis
 - Atopic Dermatitis (Eczema)
 - CTCL
 - Vitiligo
 - Lichen Planus
 - *And others...*

PUVA

So what is a "psoralen"?

Definition

Chemical compound which, upon exposure to light, produces a *phototoxic* reaction.

© 2012 Association of Certified Dermatology Techs

PUVA

So what is a "psoralen"?

Definition

Chemical compound which, upon exposure to light, produces a *photo*toxic reaction.

"requires light"

© 2012 Association of Certified Dermatology Techs

PUVA

So what is a "psoralen"?

Definition

Chemical compound which, upon exposure to light, produces a *photo*toxic reaction.

"is harmful to its surroundings"

© 2012 Association of Certified Dermatology Techs

PUVA

So what role do "psoralens" play in PUVA?

Definition

Chemical compound which, upon exposure to light, produces a *phototoxic* reaction.

© 2012 Association of Certified Dermatology Techs

PUVA

So what role do "psoralens" play in PUVA?

Definition

"8-Methoxypsoralen"
(aka "8-MOP")

Chemical compound which, upon exposure to light, produces a *phototoxic* reaction.

"UVA"

© 2012 Association of Certified Dermatology Techs

PUVA

8-Methoxypsoralen ("8-MOP" or "Methoxsalen")

- Many "psoralens", including "8-MOP", are found in nature.
- May be taken *systemically* or applied *topically*.
 - Most patients undergoing PUVA treatments are prescribed the *systemic* version.
 - "8-MOP" is taken (or applied) prior to the patient's UVA treatment.
 - For example, medications like "Oxsoralen® Capsules" are usually taken 90 minutes to 2 hours prior to UVA exposure.

Narrowband UVB

- Narrowband UVB (NB-UVB), like the UVA used in PUVA, is also a form of ultraviolet light.
 - However, **no “psoralens” are used in NB-UVB!**

© 2012 Association of Certified Dermatology Techs

Narrowband UVB

How Is NB-UVB Different?

- “Broadband” UVB (290 – 320 nm)
 - The **wavelength that causes sunburns.**
 - “UVB = UVBurn”.
 - The most harmful UV light we receive because its energy is **easily absorbed by epidermal cells.**
 - Causes DNA damage.
 - Temporarily (though significantly) has the ability to **lower immune activity in the skin.**

PUVA & UVB

General Safety Considerations

- Risks Associated w/ Ultraviolet Light
 - Increased Risk of Skin Cancer
 - Phototherapy is *generally avoided* in patients with a PMH of Melanoma, but *not necessarily* BCC/SCC.
 - Phototherapy is also *generally avoided* in patients with "photosensitive" conditions (e.g., Lupus, Porphyria, Xeroderma Pigmentosum, etc.).
 - Phototherapy should also be *used with caution* in patients taking "photosensitizing" medications.

© 2012 Association of Certified Dermatology Techs

PUVA & UVB

General Safety Considerations

- Risks Associated w/ Ultraviolet Light
 - Increased Risk of Skin Cancer
 - Covering areas "unaffected" by their skin condition may decrease risk in those areas. *For example...*
 - May leave underwear/bra on during phototherapy.
 - *Even if involved, men should keep groin covered!*

© 2012 Association of Certified Dermatology Techs

PUVA & UVB

General Safety Considerations

- Risks Associated w/ Ultraviolet Light
 - Increased Photoaging
 - Increased skin laxity, wrinkling, fragility, lentigines, etc.
 - Increased Risk of Cataracts
 - All patients (both UVB and PUVA) **must** wear eye protection while in phototherapy.
 - PUVA patients should *also* wear UVA-blocking sunglasses for up to 24 hours after taking 8-MOP!

Booth Goggles

"Wraparound"
UV Glasses

© 2012 Association of Certified Dermatology Techs

PUVA & UVB

General Safety Considerations

- Risks Associated w/ Ultraviolet Light
 - “Additional” UV Exposure Should Be Avoided
 - Patients can have *too much UV exposure* if they’re also “laying out” or going to tanning bed in addition to phototherapy.
 - PUVA patients in particular should limit UV exposure for up to 24 hours after treatment!

© 2012 Association of Certified Dermatology Techs

PUVA & UVB

What About Use In Pregnancy?

- Ultraviolet light *alone* is generally considered safe during pregnancy.
- PUVA, because of its use of 8-MOP, is ***not recommended during pregnancy.***
 - Females should be told this in case they become (or are) pregnant!

© 2012 Association of Certified Dermatology Techs

PUVA & UVB

How Are Treatment Regimens Determined?

- Determining which version of phototherapy to use, or exactly how it’s administered, *is completely up to your supervising physician and office protocol.*
 - Phototherapy is the type of procedure that requires “hands-on” training for full safety and understanding.
 - **This module is intended to provide you with a solid foundation for such training, but by no means replaces it!**

© 2012 Association of Certified Dermatology Techs

PUVA & UVB

Before receiving “in-office” phototherapy training, you should know...

- Either the patient’s “Skin Type” **or** their “Minimal Erythema Dose” (MED) are used to determine treatment protocol.
 - Skin Type
 - Our “UV Light, Sunscreen, & Skin Type” module reviews “Skin Type” in detail!

© 2012 Association of Certified Dermatology Techs

PUVA & UVB

Before receiving “in-office” phototherapy training, you should know...

- Either the patient’s “Skin Type” **or** their “Minimal Erythema Dose” (MED) are used to determine treatment protocol.
 - Minimal Erythema Dose (MED)

Definition

The minimum amount of energy required to produce uniform redness (erythema) 24 hours after exposure to ultraviolet radiation.

© 2012 Association of Certified Dermatology Techs

PUVA & UVB

Before receiving “in-office” phototherapy training, you should know...

- Phototherapy “dosages” are typically measured in “millijoules per square centimeter” (mJ/cm²).

Example

A psoriasis patient with “Skin Type” III needs to start narrowband UVB phototherapy today. The office protocol indicates that this patient would start treatment at a “dose” of 260 mJ/cm².

Blue Light PDT

© 2012 Association of Certified Dermatology Techs

Blue Light PDT

So what is "Photodynamic Therapy" (PDT)?

Definition

The use of a photosensitive agent that, when exposed to light, absorbs and subsequently transfers energy to adjacent cells, thereby resulting in therapeutic change to the surrounding tissue.

© 2012 Association of Certified Dermatology Techs

Blue Light PDT

So what is "Photodynamic Therapy" (PDT)?

Definition

"Aminolevulinic Acid"
(aka "Levulan®")

The use of a photosensitive agent that, when exposed to light, absorbs and subsequently transfers energy to adjacent cells, thereby resulting in therapeutic change to the surrounding tissue.

"Blue Light"

© 2012 Association of Certified Dermatology Techs

Blue Light PDT

• Aminolevulinic Acid (Levulan®)

– A type of "porphyrin".

- Has the ability to *absorb* light energy, and then *release* that energy to its surroundings, **essentially causing "controlled destruction" of neighboring tissue.**

– *Useful in dermatology because...*

- Can be applied topically.
- Absorbed fairly rapidly.
- Has an affinity for keratinocytes – *particularly "atypical" keratinocytes.*

© 2012 Association of Certified Dermatology Techs

Levulan® Kerastick®

© 2012 Association of Certified Dermatology Techs

Blue Light PDT

- Blue Light (BLU-U®)
 - BLU-U® is able to penetrate up to 2 mm into the skin.
 - Emits light at ~ 417 nm.
 - Blue Light is not a form of UV light!
 - It is only effective because “porphyrins” are sensitive to the “blue” wavelength of light.
 - Provides maximum “porphyrin response” after 1000 seconds.
 - The reason why many treat for “16 min 40 sec”.

Blue Light PDT

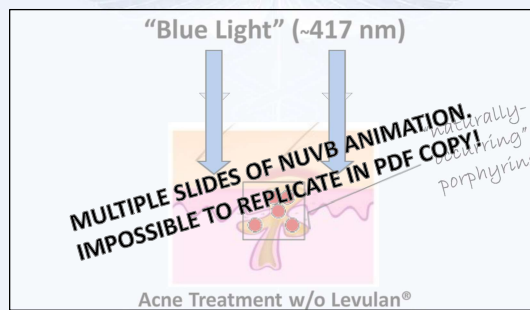

© 2012 Association of Certified Dermatology Techs

Blue Light PDT

General Considerations

- Blue Light PDT is *generally avoided* in patients with “photosensitive” conditions (e.g., Lupus, Porphyria, etc.).
- Patients will likely experience some degree of redness, crusting, stinging, itching, and inflammation both *during treatment and for about 5-7 days thereafter*.
 - Many patients report that the reaction looks/feels similar to that caused by Efudex® or Carac®, but that the duration isn’t nearly as long.

© 2012 Association of Certified Dermatology Techs

Blue Light PDT

General Considerations

- **Patients should avoid “strong” light sources for up to 40 hours after Aminolevulinic Acid has been applied to the skin!**
 - This includes *either* sunlight **OR** bright indoor lighting.
 - Should even wear a wide-brimmed hat when going to their car after the PDT treatment.
 - Simply applying sunblock **does not** protect patients from the “blue light” wavelengths.
 - Even after Levulan® loses its effect, any inflamed skin should be protected.
