Skin Cancer

- Screening for, diagnosing, and treating skin cancer is...
 - One of the most *important* tasks your supervising physician performs.
 - One of the most *common* tasks performed.
- Clinical support staff members like you play a vital role in this process.

© 2012 Association of Certified Dermatology Techs

Skin Cancer

The “big three” skin cancers are...

- Basal Cell Carcinoma
 - Squamous Cell Carcinoma
 - Melanoma
- } “Non-Melanoma Skin Cancer” (NMSC)

© 2012 Association of Certified Dermatology Techs

Basal Cell Carcinoma

© 2012 Association of Certified Dermatology Techs

Skin Cancer

BASAL CELL CARCINOMA

- Background
 - Most common cancer (of any type) in the world.
 - >1,000,000 occur every year in the United States alone.
 - 75-80% of skin cancers are Basal Cell Carcinomas.

© 2012 Association of Certified Dermatology Techs

Skin Cancer

BASAL CELL CARCINOMA

- Risk Factors
 - Ultraviolet Light
 - Fair Skin
 - Inability to tan
 - Light-colored eyes
 - Light-colored hair
 - Advanced Age

© 2012 Association of Certified Dermatology Techs

Skin Cancer

BASAL CELL CARCINOMA

- Presentation

- Can occur *almost* anywhere on the body.
 - Face, ears, and neck most common.
- Patients often think they are a “pimple”, abrasion, or even an insect bite that just wouldn’t heal.
 - Usually does NOT present as a “dark mole”.

Skin Cancer

© 2012 Association of Certified Dermatology Techs

Skin Cancer

BASAL CELL CARCINOMA

- Most Common Subtypes

- Superficial
- Nodular
- Pigmented
- Infiltrative
 - Morpheaform
 - Micronodular
- Basosquamous

© 2012 Association of Certified Dermatology Techs

Skin Cancer

BASAL CELL CARCINOMA

- Prognosis
 - Often referred to as “the best kind of skin cancer to have”.
 - Metastasis is *exceedingly rare* (<1%).
 - Tend to grow very slowly.
 - Eventually will destroy surrounding tissue if left untreated.
 - Vital structures such as the eyes, ears, and nose are particularly vulnerable to damage and/or disfigurement.

© 2012 Association of Certified Dermatology Techs

Squamous Cell Carcinoma

© 2012 Association of Certified Dermatology Techs

Skin Cancer

SQUAMOUS CELL CARCINOMA

- Background
 - Second in frequency behind Basal Cell Carcinoma.
 - Est. 200,000 diagnosed annually in United States alone.

© 2012 Association of Certified Dermatology Techs

Skin Cancer

SQUAMOUS CELL CARCINOMA

- Risk Factors
 - Ultraviolet Light
 - Fair Skin
 - Advanced Age
 - Actinic Keratoses
 - Immunosuppression
 - Radiation Exposure
 - Burn Scars
 - Human Papilloma Virus

© 2012 Association of Certified Dermatology Techs

Skin Cancer

SQUAMOUS CELL CARCINOMA

- Presentation
 - Can occur almost anywhere.
 - Face, ears, dorsal hands, and forearms *most common*.
 - SCC can also occur on the oral mucosa.
 - SCC on legs is not uncommon in elderly females who used to play golf, tennis, or sunbathe.
 - Often presents as a non-healing, scaling or crusting “sore” that just doesn’t go away.

Skin Cancer

© 2012 Association of Certified Dermatology Techs

Skin Cancer

SQUAMOUS CELL CARCINOMA

- Most Common Subtypes
 - Superficial
 - aka, “Bowen’s Disease” or “SCC In Situ”
 - Keratoacanthoma-type
 - Typical SCC often classified by “differentiation”
 - Well-differentiated (least atypical)
 - Moderately-differentiated
 - Poorly-differentiated (most atypical)

© 2012 Association of Certified Dermatology Techs

Skin Cancer

SQUAMOUS CELL CARCINOMA

- Prognosis
 - SCC *does have* a real potential to metastasize!
 - However, the overwhelming majority **do not**.
 - The greatest risk of metastasis occurs in....
 - Very deep lesions (extending to bone, muscle, or nerve tissue).
 - Immunosuppressed patients.
 - Lesions which are “poorly-differentiated”.
 - Lesions arising within a scar (e.g., “burn scar”).
 - Those which arise on the lip (~14%).

© 2012 Association of Certified Dermatology Techs

Skin Cancer

Most Common NMSC Treatments

- Traditional Excision
- Mohs Surgery
- Electrodesiccation and Curettage
- Topical Chemotherapy
- Radiation Therapy (aka, “XRT”)
- Erivedge® (BCC Only)

© 2012 Association of Certified Dermatology Techs

Melanoma

© 2012 Association of Certified Dermatology Techs

Skin Cancer

MELANOMA

- Background
 - To the public, it's the most “familiar” of all skin cancers.
 - Many mistakenly believe that *all* skin cancers are “melanoma”.
 - Even though it accounts for only 5% of skin cancers, it is responsible for nearly 80% of skin cancer deaths!

© 2012 Association of Certified Dermatology Techs

Skin Cancer

MELANOMA

- Facts
 - The ACS estimates over 75,000 new cases of melanoma are diagnosed every year.
 - **Over 9,000 will die!**
 - The overall lifetime risk of melanoma:
 - 1 in 50 for whites.
 - 1 in 200 for Hispanics.
 - 1 in 1,000 for blacks.

© 2012 Association of Certified Dermatology Techs

Skin Cancer

MELANOMA

- Risk Factors
 - Fair Skin
 - Light-Colored Eyes
 - Red or Blonde Hair
 - Presence of > 100 Nevi
 - Any Dysplastic Nevi
 - Large Congenital Nevus

© 2012 Association of Certified Dermatology Techs

Skin Cancer

MELANOMA

- Risk Factors (cont.)
 - Personal History of Melanoma
 - BCC/SCC **do not** turn into melanoma!
 - Family History of Melanoma (1° Relative)
 - Xeroderma Pigmentosum
 - Certain Gene Mutations (e.g., “P16”)
 - **ULTRAVIOLET LIGHT!!**

© 2012 Association of Certified Dermatology Techs

Skin Cancer

MELANOMA

- Risk Factors (cont.)
 - **ULTRAVIOLET LIGHT!!**
 - Both chronic and intense intermittent exposure increase melanoma risk.
 - Just one blistering sunburn during childhood can *double* chance of melanoma later in life!
 - Tanning beds, and even PUVA and UVB in dermatology office can increase risk.

© 2012 Association of Certified Dermatology Techs

Skin Cancer

MELANOMA

- Presentation
 - Can occur *anywhere* on the body.
 - Slightly more common on the legs in women.
 - Slightly more common on the back in men.

CAN OCCUR ANYWHERE!!

© 2012 Association of Certified Dermatology Techs

Skin Cancer

MELANOMA

- Presentation

- ABCDs of Melanoma

- Meant to serve as a screen for lesions which may be suspicious for melanoma.
- NOT a perfect screening tool!
 - It's very sensitive, but not very specific.

© 2012 Association of Certified Dermatology Techs

A – Asymmetry

© 2012 Association of Certified Dermatology Techs

B – Border (irregular)

C – Color (very dark or varied)

© 2012 Association of Certified Dermatology Techs

C – Change (constant/ongoing)

© 2012 Association of Certified Dermatology Techs

D – Diameter (> 6 mm)

© 2012 Association of Certified Dermatology Techs

Skin Cancer

MELANOMA

- Presentation
 - There will *always* be exceptions to the rule!
 - Amelanotic melanoma is the most notable.
 - Have no pigment, therefore aren't dark.
 - Very difficult to diagnose using traditional ABCD criteria.
 - » However, screening techniques used for BCC/SCC can help to discover them.

© 2012 Association of Certified Dermatology Techs

Skin Cancer

MELANOMA

- Presentation
 - The majority of melanomas **do not** arise from within a mole.
 - All lesions should be monitored, but melanoma more likely to be found in *newly-forming* lesions.
 - Many patients think moles “must” be raised/elevated.
 - If only raised/elevated lesions are monitored, then melanoma in its earliest stages can be missed.

Skin Cancer

MELANOMA

- Most Common Subtypes
 - Superficial Spreading Melanoma

© 2012 Association of Certified Dermatology Techs

Skin Cancer

MELANOMA

- Most Common Subtypes
 - Nodular Melanoma

© 2012 Association of Certified Dermatology Techs

Skin Cancer

MELANOMA

- Most Common Subtypes
 - “Growth Pattern”
 - Superficial Spreading Melanoma
 - Nodular Melanoma

© 2012 Association of Certified Dermatology Techs

Skin Cancer

MELANOMA

- Most Common Subtypes
 - Level of “Invasion”
 - Melanoma In Situ
 - Confined to the epidermis *only*.
 - “Invasive” Melanoma
 - Any melanoma which *isn't* “in situ”.
 - » Melanoma which has moved beyond the epidermis and has “invaded” at least the underlying dermis.

© 2012 Association of Certified Dermatology Techs

Skin Cancer

MELANOMA

- Other Common Subtypes
 - Lentigo Maligna
 - Simply a melanoma *in situ* which formed within a pre-existing “lentigo”.
 - Lentigo Maligna Melanoma
 - “Invasive” version of a “Lentigo Maligna”.
 - Acral Lentiginous Melanoma
 - Name given to melanoma which arises on the palms, soles, beneath the nails, or on the mucosal surfaces.

© 2012 Association of Certified Dermatology Techs

Skin Cancer

MELANOMA

- Prognosis
 - **Good News**
 - The *vast majority* of melanomas are easily excised and never metastasize.
 - **Bad News**
 - A *significant minority* of patients who are diagnosed with melanoma will have metastasis and eventually die.
 - Of 75,000 patients diagnosed, over 9,000 will die.

Skin Cancer

MELANOMA

- Prognostic Considerations
 - Clark’s Level

© 2012 Association of Certified Dermatology Techs

Skin Cancer

MELANOMA

- Prognostic Considerations
 - Breslow Depth

© 2012 Association of Certified Dermatology Techs

Skin Cancer

MELANOMA

- Prognostic Considerations
 - 5-Year Survival Rate

Example

Breslow Depth < 1 mm
Non-Ulcerated
95% 5-Year Survival Rate

© 2012 Association of Certified Dermatology Techs

Skin Cancer

MELANOMA

- Prognostic Considerations
 - 5-Year Survival Rate

Example

Breslow Depth 4.5 mm
Ulcerated
45% 5-Year Survival Rate

© 2012 Association of Certified Dermatology Techs

Skin Cancer

Melanoma Treatment

–Surgical

- Margins always taken.
 - As little as 0.5 cm to as much as 2 cm.
- Sentinel Lymph Node (SLN) Biopsy?
 - Blue dye and radioactive “technetium-99” solution injected into the tissue surrounding melanoma site.
 - Draining node(s) are removed and tested for any sign of metastatic melanoma.

© 2012 Association of Certified Dermatology Techs

Skin Cancer

Melanoma Treatment

–Adjuvant

- Chemotherapy
 - Dacarbazine
- Immunotherapy
 - Interleukin-2
- Vaccines (various)
- New Medications
 - Ipilimumab
 - Vemurafenib

NONE have been shown to **significantly** affect long-term survival!
