

## Epic Upgrade Overview for AP & CP Beaker

Below are the highlights of the November 9th, 2025 Epic Upgrade.

### Epic Upgrade Highlights: CP and AP Beaker

#### Track Lab Order Progress in Chart Review

- Clinicians can easily track the progress of lab orders on the **Labs tab** in **Chart Review** starting at the placement of the order and ending with the final result resulting in fewer calls to the lab.

#### Specimen Ordering & Collection

- When routine tests are ordered alongside duplicate, existing timed priority orders, users will see the option to cancel the redundant timed order and upgrade lower priority orders to a single timed order, similar to STAT priority orders.

#### Chart Search

- Use Chart Search activity button in the **Actions** menu without leaving the Outstanding List to access patient information.

#### Results Review

- To help make lab result graphs easier to interpret, clinicians can now trend lab results data along the same y-axis by checking the Single y-axis checkbox above the legend.

### Epic Upgrade Highlights: CP Beaker

#### Rover Updates

- Save time by searching for other users and departments when documenting specimen collection on behalf of another user.

### Additional Updates: Reporting

#### SlicerDicer

- Use the new Result Component ID filter to limit your results to specific result components when components share a common name.
- Filter by lab expected turnaround time in days rather than minutes, which might be helpful for tests like cultures that typically take multiple days, Current report build will stay at minutes. Also, new filters allow you to search by procedure name, which might be more recognizable than the test's external name.

#### Reporting Workbench

- Search for lab report, dashboards and more from the Assistant Bar. Type in the name of a report in the Assistant Bar and then select the Analytics Catalog search result to open that activity with your search already performed.
- User new **relative date options** in Weekly and Yearly reporting instead of exact dates to now include beginning of this week (**WB**), end of this week (**WE**), beginning of this year (**YB**), and end of this year (**YE**)

### Additional Updates: Scanning

#### Release and Result Future and Standing Orders when in Media Manager

- Finalize future and standing orders directly from the Document Batch Editor and Media Manager for result-level document types, rather than the current process of manually releasing the order from Order Review, resulting, and then attaching it in Media Manager.

### Workqueues

#### Filter Your Workqueue Results with Precision

If you want to Filter your Workqueues, for example a Referral workqueue by the columns in the queue, you'll notice a new tab added to the filter settings.
