

Clinician: Knutson, Brian MD
AMG Dermatology
6701 S. Minnesota Ave
Sioux Falls, SD 57108

Patient Name: Miller, Bill	Accession #: B15-008755
DOB: 4/3/1939	Date of Surgery: 05/12/2015
Sex: Male	Date Received: 05/14/2015
Age: 76	Report Date: 05/22/2015
	Medical Record #:

Tissue Site: Left upper back
Procedure: Biopsy/Excision 2 Slides

Preop Dx: MIS

Gross Exam:

Received is a 4.7 x 1.3 x 1.0 cm skin ellipse. Serially sectioned and submitted 1 (both tips) through 5.

Microscopic Exam:

The epithelium is regenerative. The underlying dermis shows scar formation with angioplasia, fibroplasia and a patchy lymphohistiocytic infiltrate. These changes are consistent with the previous surgical procedure. There is no evidence of residual neoplasm.

Diagnosis:

Skin, left upper back: Surgical cicatrix (scar); no residual neoplasm; see comment

Comment:

Small foci of incidental nevi are identified within the specimen, as well as areas of reactive lentiginous melanocytic hyperplasia adjacent to the cicatrix, however residual malignant melanoma in-situ is not seen.
